

Progenetix & Beacon+

An open cancer genomics resource on a stack of Beacon code...

Global Alliance “Beacon” - Jim Ostell, NCBI, March 7, 2014

Introduction

... I proposed a challenge application for all those wishing to seriously engage in *international* data sharing for human genomics. ...

1. Provide a public web service
2. Which accepts a query of the form “Do you have any genomes with an “A” at position 100,735 on chromosome 3?”
3. And responds with one of “Yes” or “No” ...

“Beacon” because ... people have been scanning the universe of human research for *signs of willing participants in far reaching data sharing*, but ... it has remained a dark and quiet place. The hope of this challenge is to 1) *trigger the issues* blocking groups ... in way that isn’t masked by the ... complexities of the science, fully functional interfaces, and real issues of privacy, and to 2) in *short order* ... see *real beacons of measurable signal* ... from *at least some sites* ... Once your “GABeacon” is shining, you can start to take the *next steps to add functionality* to it, and *finding the other groups* ... following their GABeacons.

Utility

Some have argued that this simple example is not “useful” so nobody would build it. Of course it is not the first priority for this application to be scientifically useful. ...intended to provide a *low bar for the first step of real ... engagement*. ... there is some utility in ...locating a rare allele in your data, ... not zero.

A number of more useful first versions have been suggested.

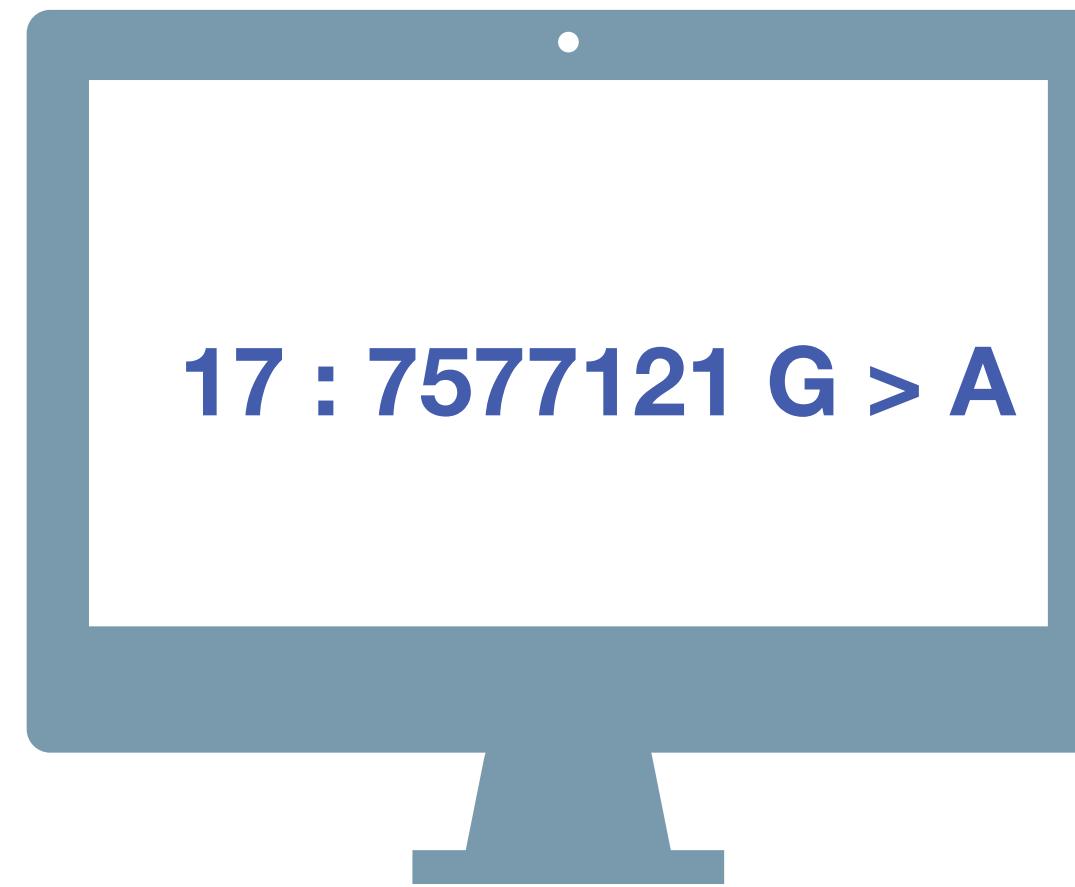

1. Provide *frequencies of all alleles* at that point
2. Ask for all alleles seen in a gene *region* (and more elaborate versions of this)
3. Other more complicated queries

"I would personally recommend all those be held for
version 2, when the beacon becomes a service."
Jim Ostell, 2014

Implementation

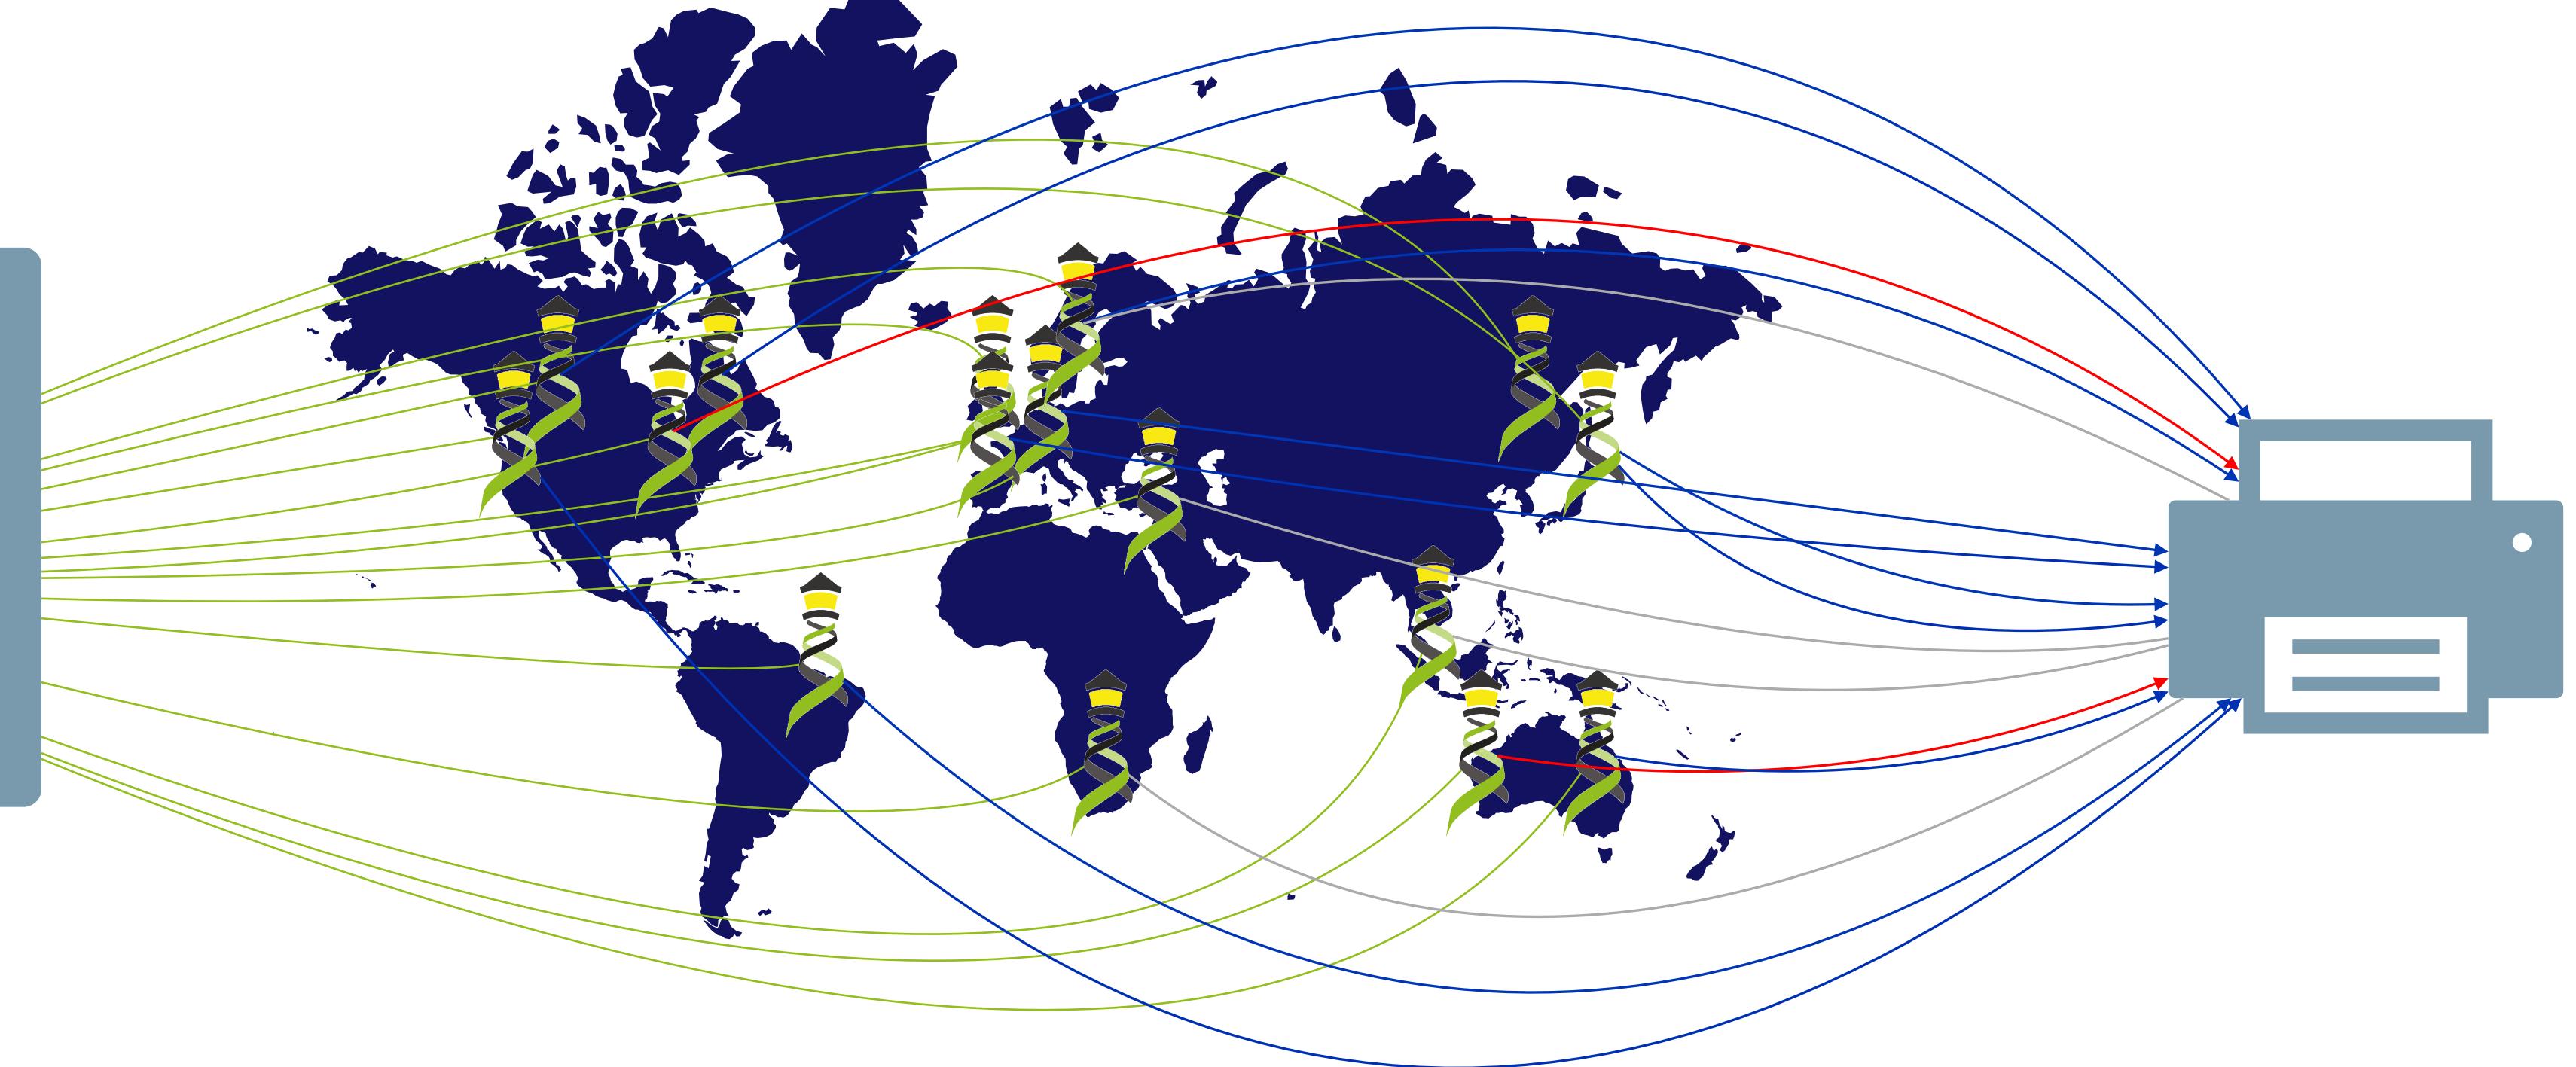

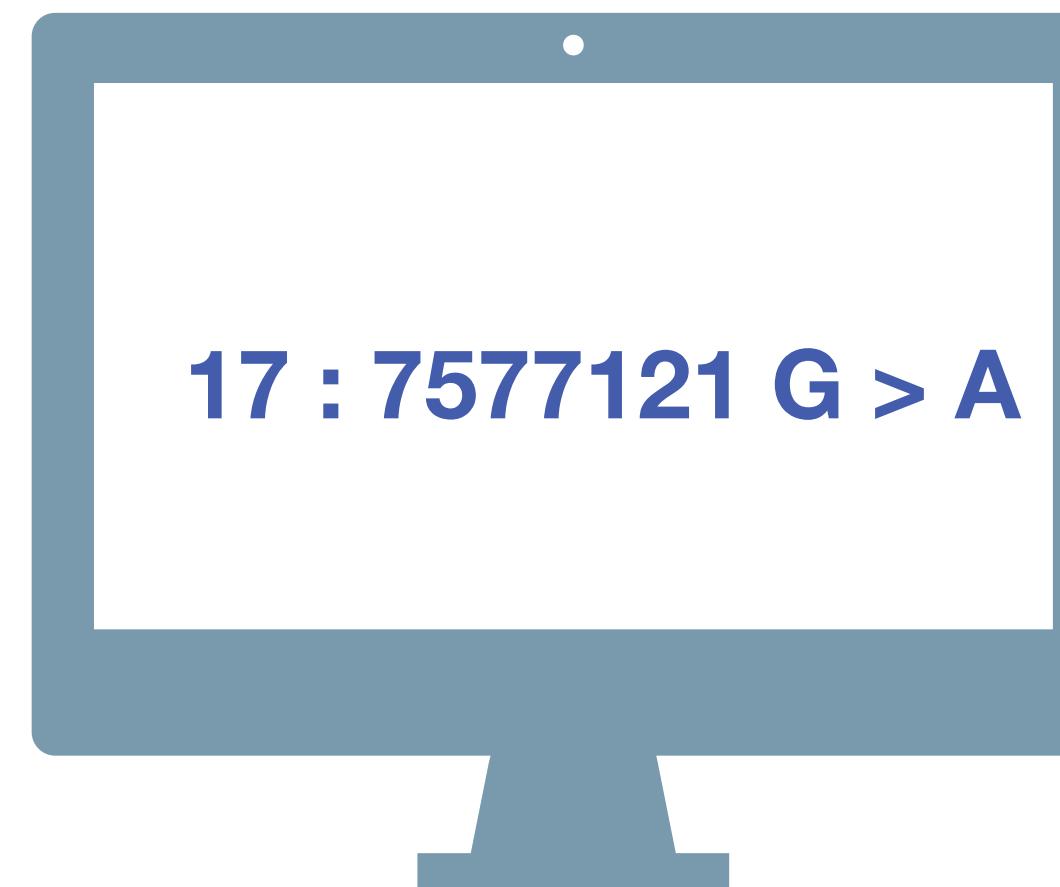

1. Specifying the chromosome ... The interface needs to specify the *accession.version* of a chromosome, or *build number*...
2. Return values ... right to *refuse* to answer without it being an error ... DOS *attack* ... or because ...especially *sensitive*...
3. Real time response ... Some sites suggest that it would be necessary to have a “*phone home*” response ...

Beacon

A **Beacon** answers a query for a specific genome variant against individual or aggregate genome collections

YES | NO | \0

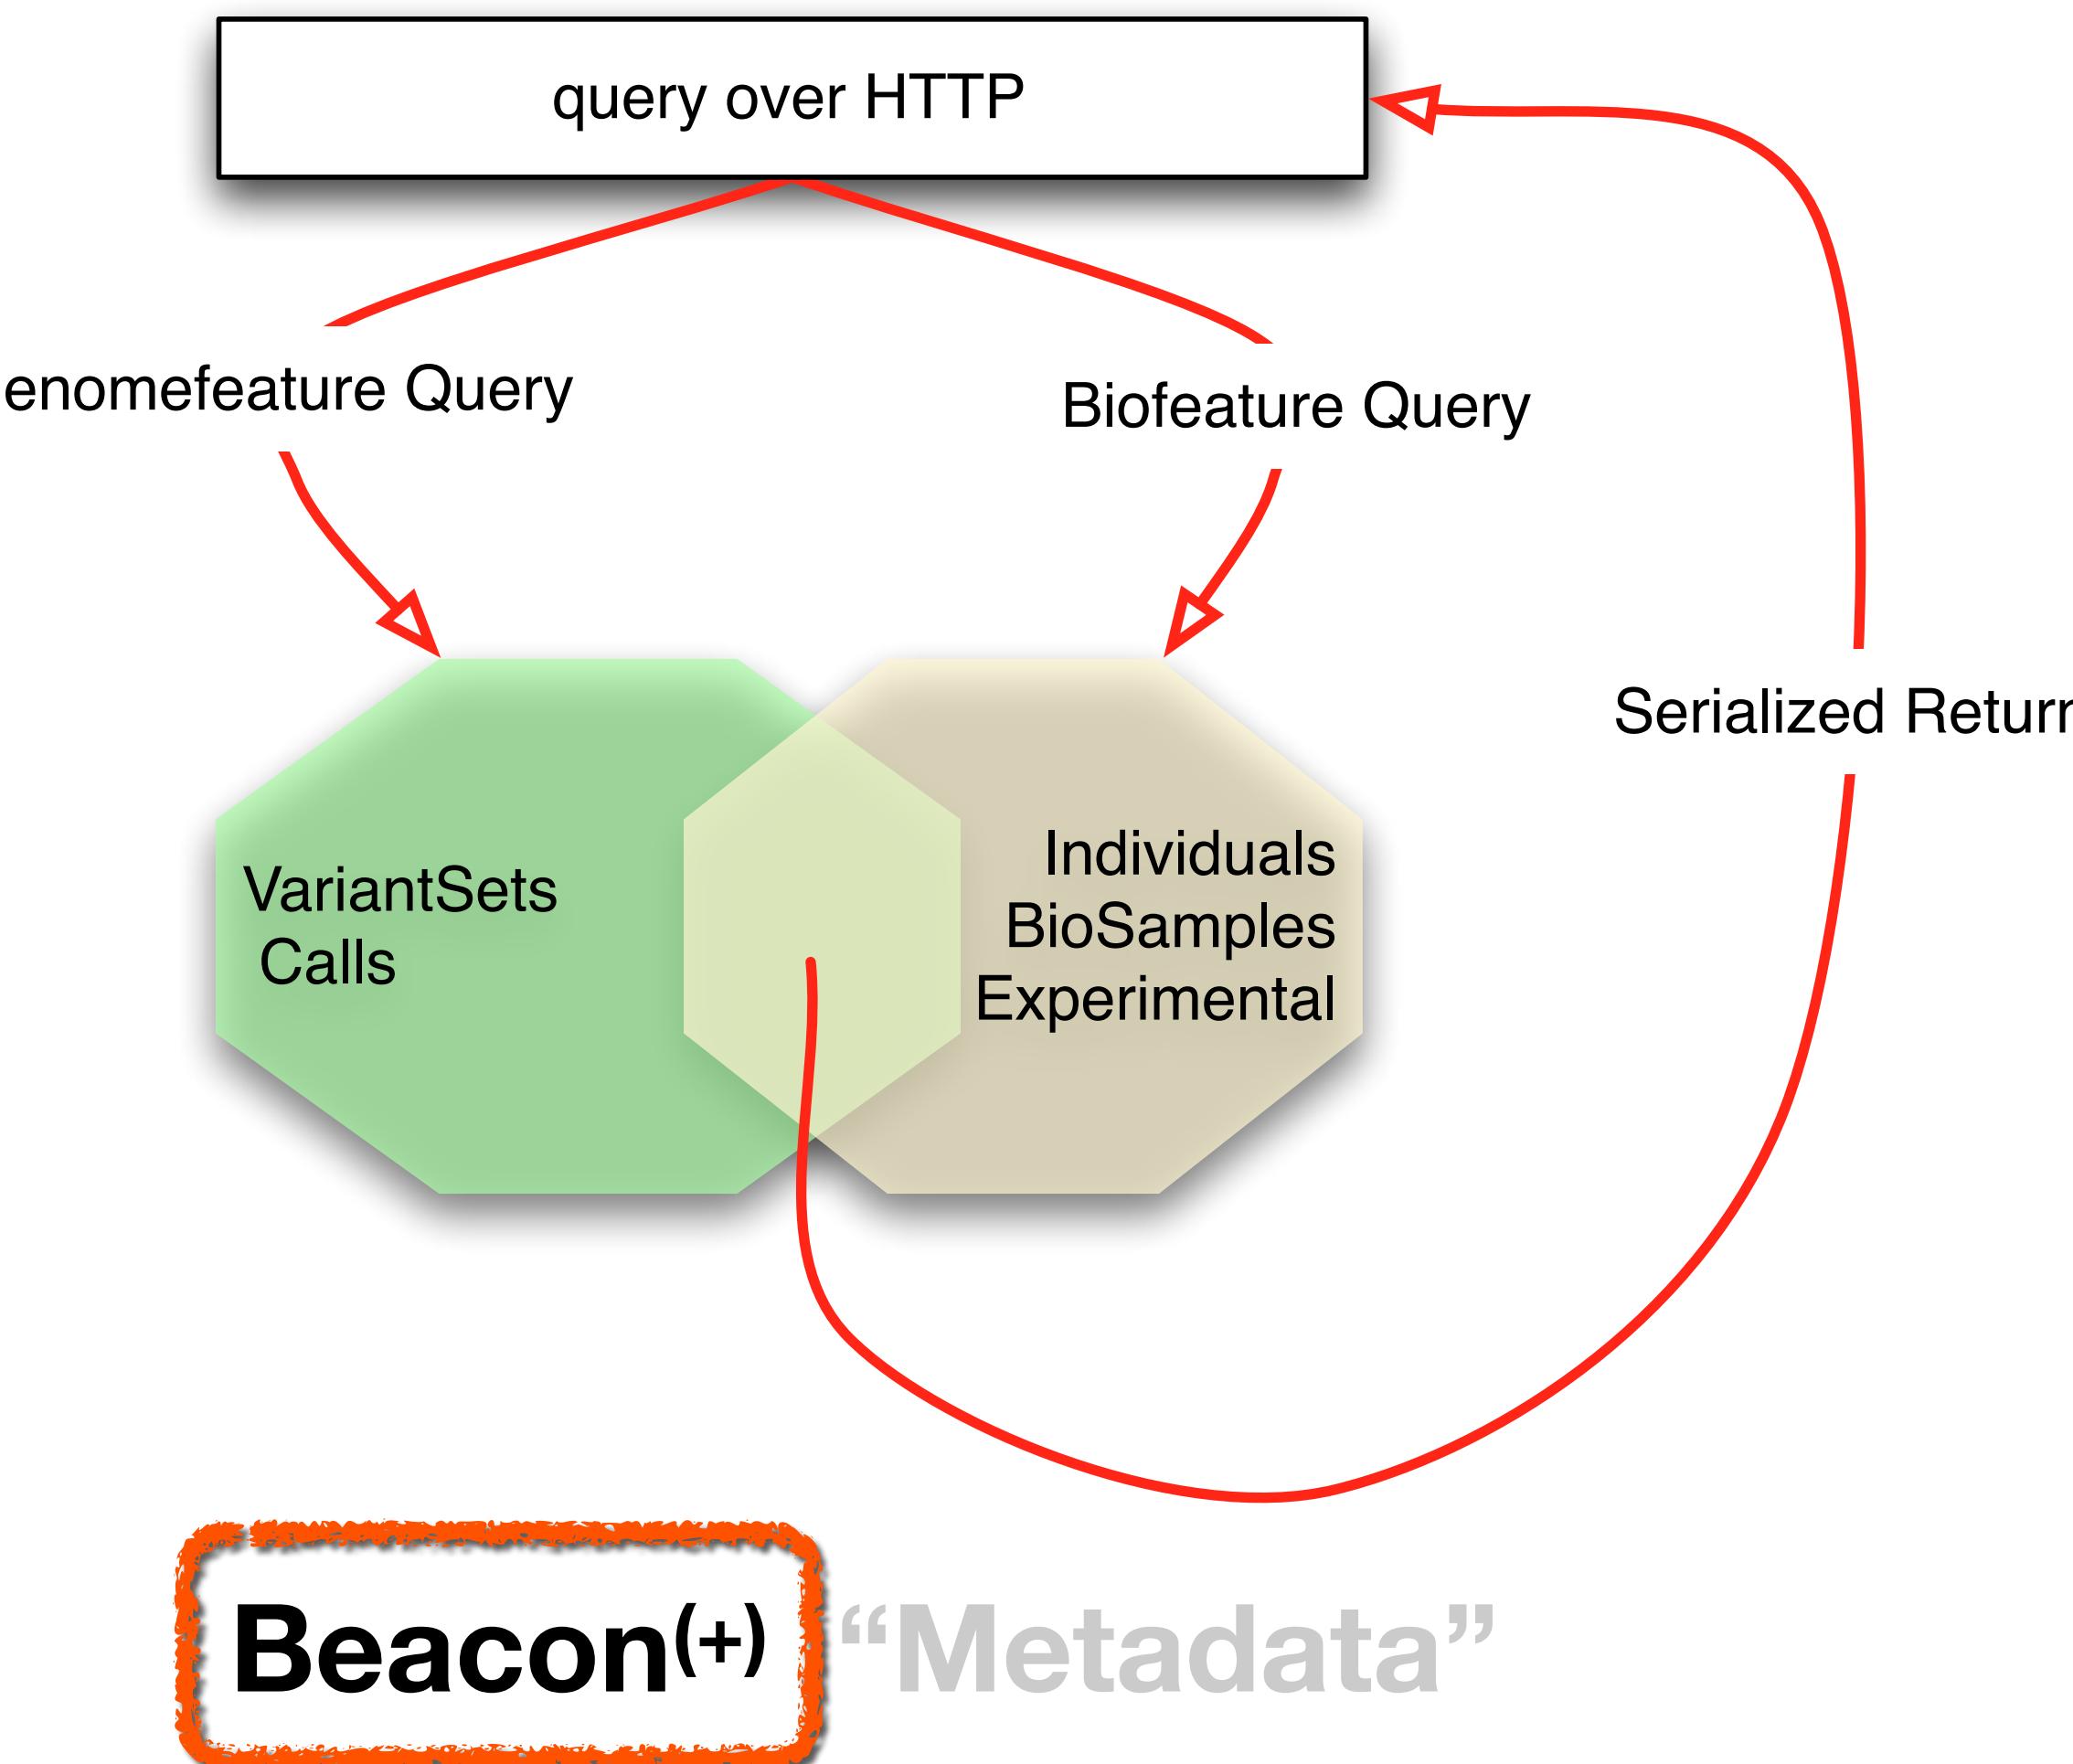

Have you seen this variant?
It came up in my patient
and we don't know if this is
a common SNP or worth
following up.

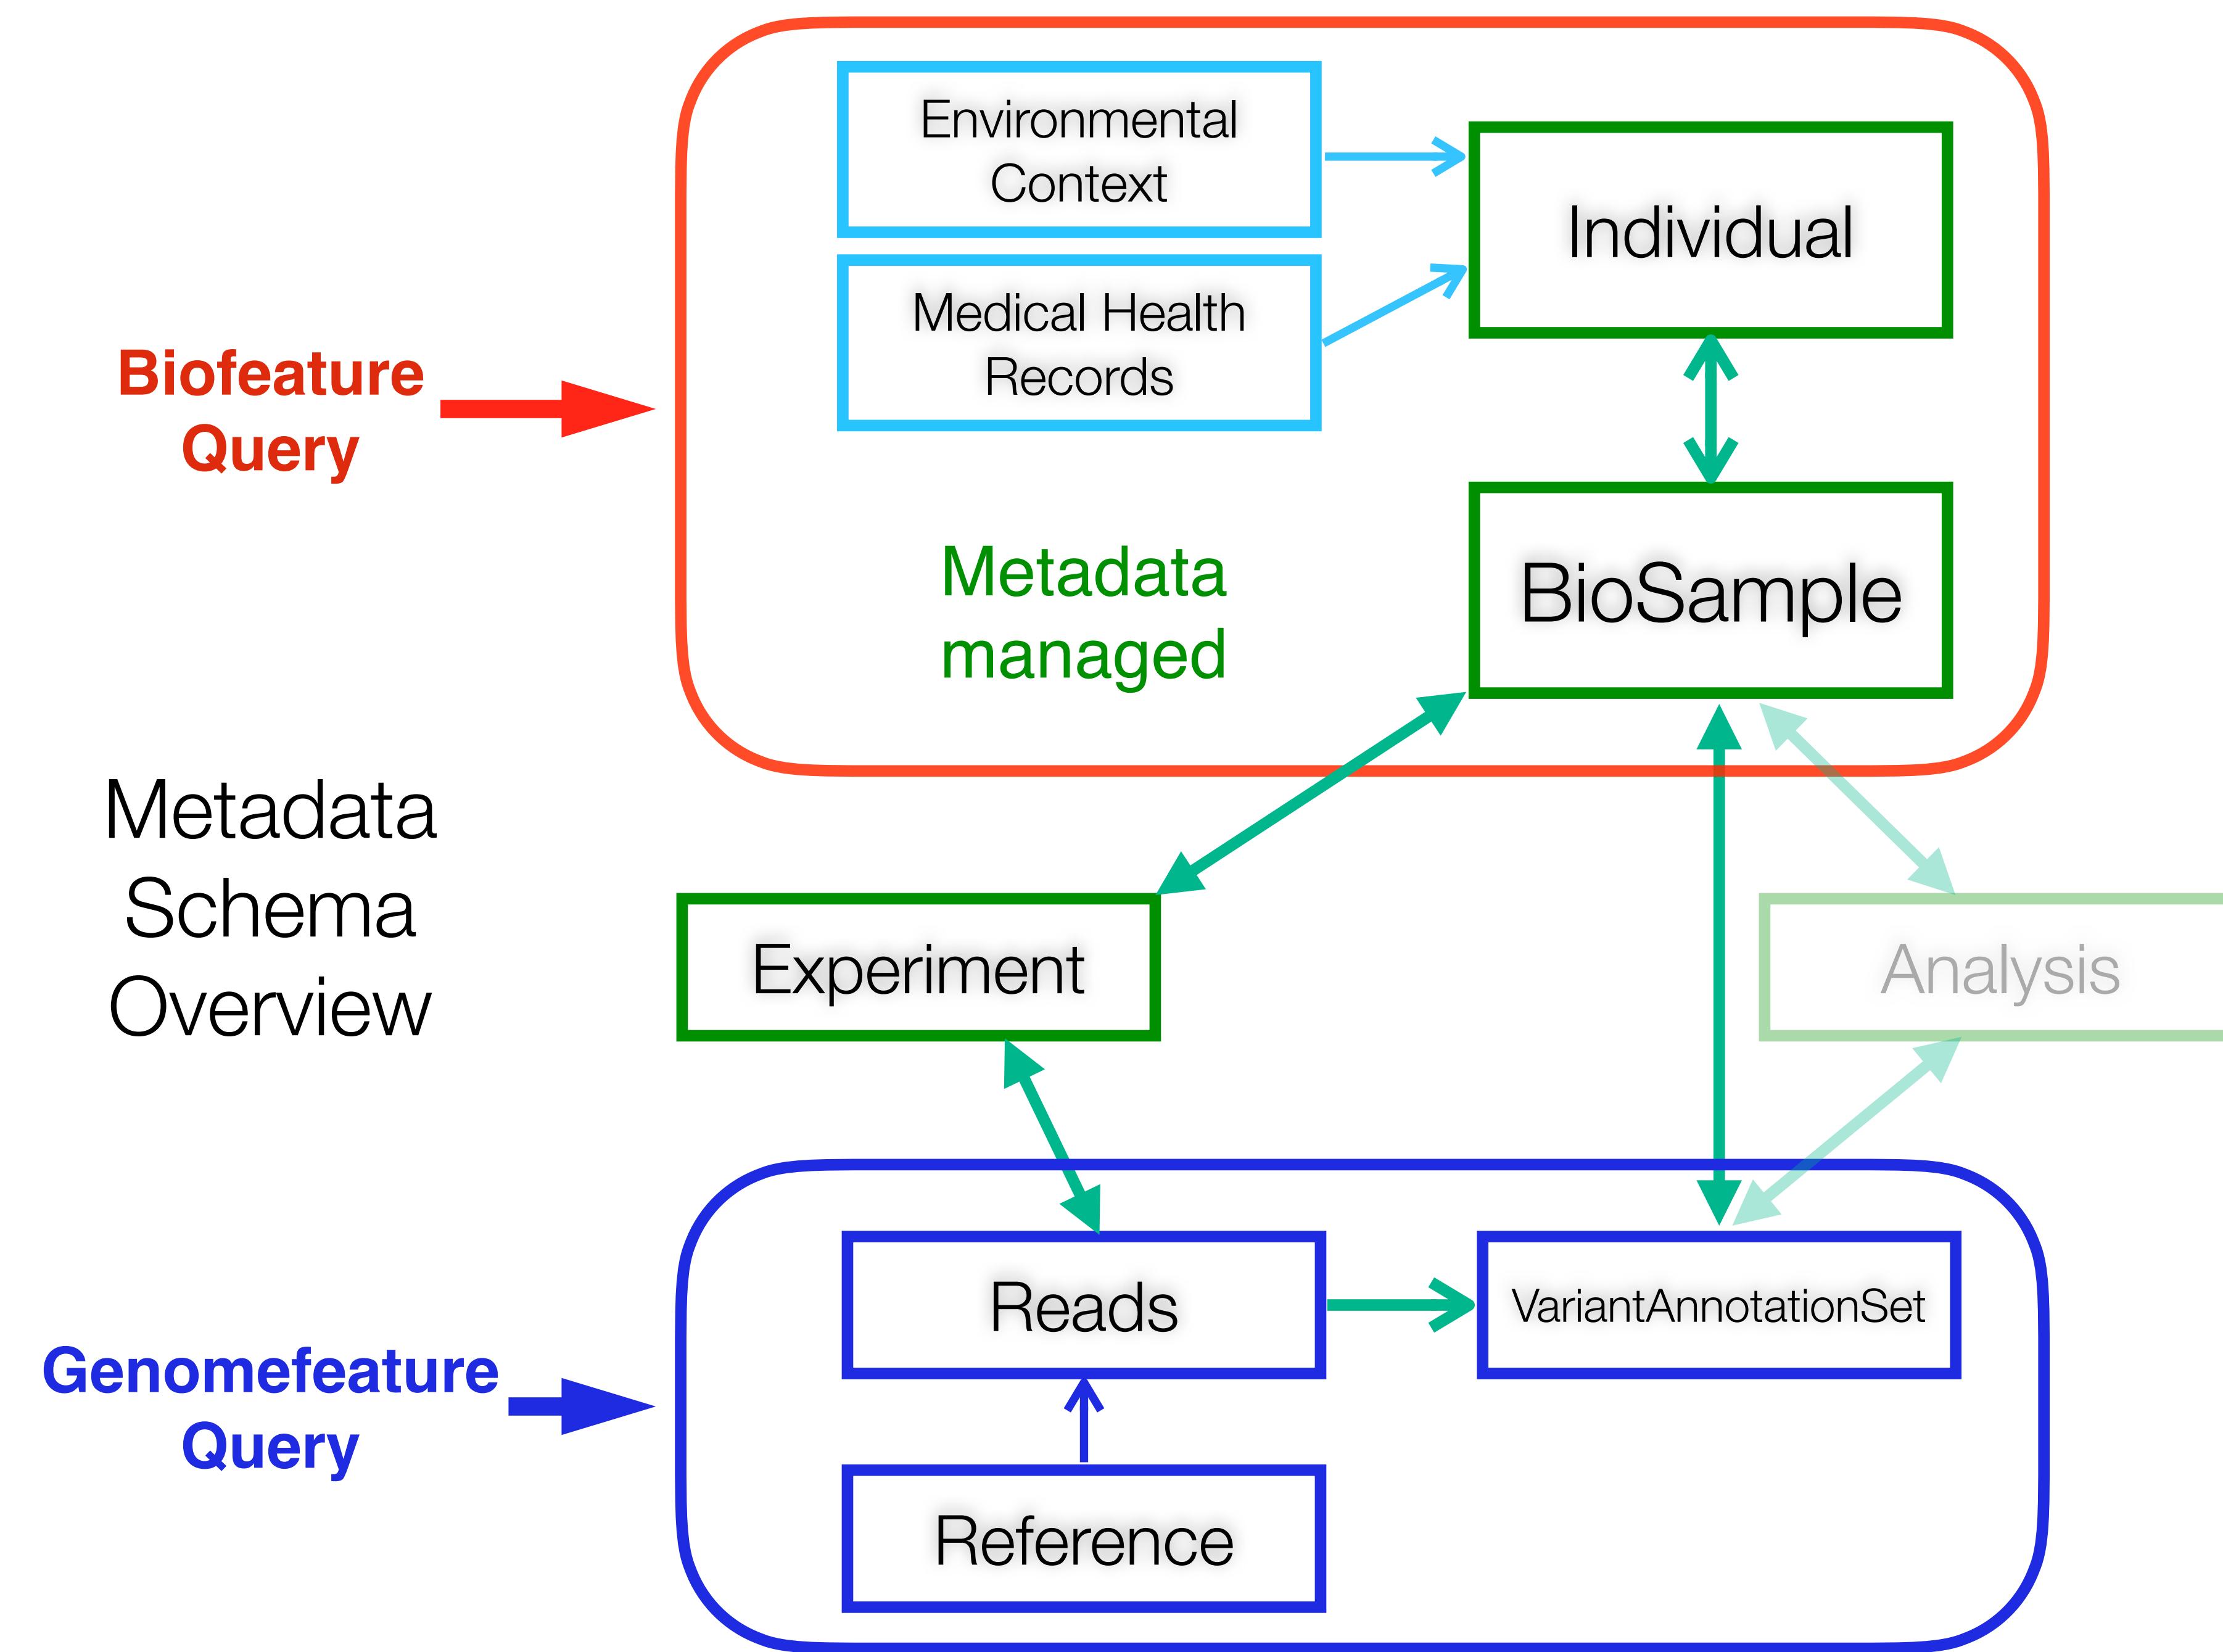

A Beacon network federates
genome variant queries
across databases that
support the **Beacon API**

Here: The variant has
been found in **few**
resources, and those
are from **disease**
specific **collections**.

Minimal GA4GH query API structure

Beacon+ in 2016 - Driving GA4GH implementations

This forward looking Beacon interface implements additional, planned features.

Query

Dataset	tcga
Reference name*	9
Genome Assembly*	GRCh38 / hg38
Start min Position*	19,500,000
Start max Position	21,975,098
End min Position	21,967,753
End max Position	24,500,000
Alt. Base(s)*	DEL
Bio-ontology	icdot:c50.9: (4065)

Beacon Implementations

- implementing existing resources with Beacon protocol
- e.g. TCGA cancer variants (structural and SNV)

Beacon Response

- quantitative (counts for variants, callsets and samples)
- *Handover* to authentication system for data retrieval
- **no exposure** of data beyond standard Beacon response and additional pointer to matched data

Prototyping Query Extensions

- testing e.g. bio-metadata queries using ontology terms

Dataset	Assembly	Chro	Start Range	End Range	Pos	Ref Alt	Bio Query	Variants Calls Samples	f_alleles	Response Context
tcga	hg38	9	19,500,000 21,975,098	21,967,753 24,500,000		DEL	icdot:c50.9:	54 54 54	0.0243	JSON UCSC Handover

arrayMap progenetix This Beacon implementation is developed by the Computational Oncogenomics Group at the University of Zurich, with support from the SIB Technology group and ELIXIR.

59428 matched callsets for 3602919 variants. Out of 62105 biosamples in
the database, 2047 matched the biosample query; of those, 584 had the
variant.",
      "ontology_ids" : [
        "ncit:C3058",
        "pgx:icdom:9440_3",
        "pgx:icdot:C71.9",
        "pgx:icdot:C71.0"
      ]
    }
  }
]
}

```

Translation for Store (here MongoDB)

Match using query ranges “at least one base in interval affected”

Region of Interest,
e.g. CDR of Gene
(here: CDKN2A)

Example “focal”
matches (overlap w/ size limit)

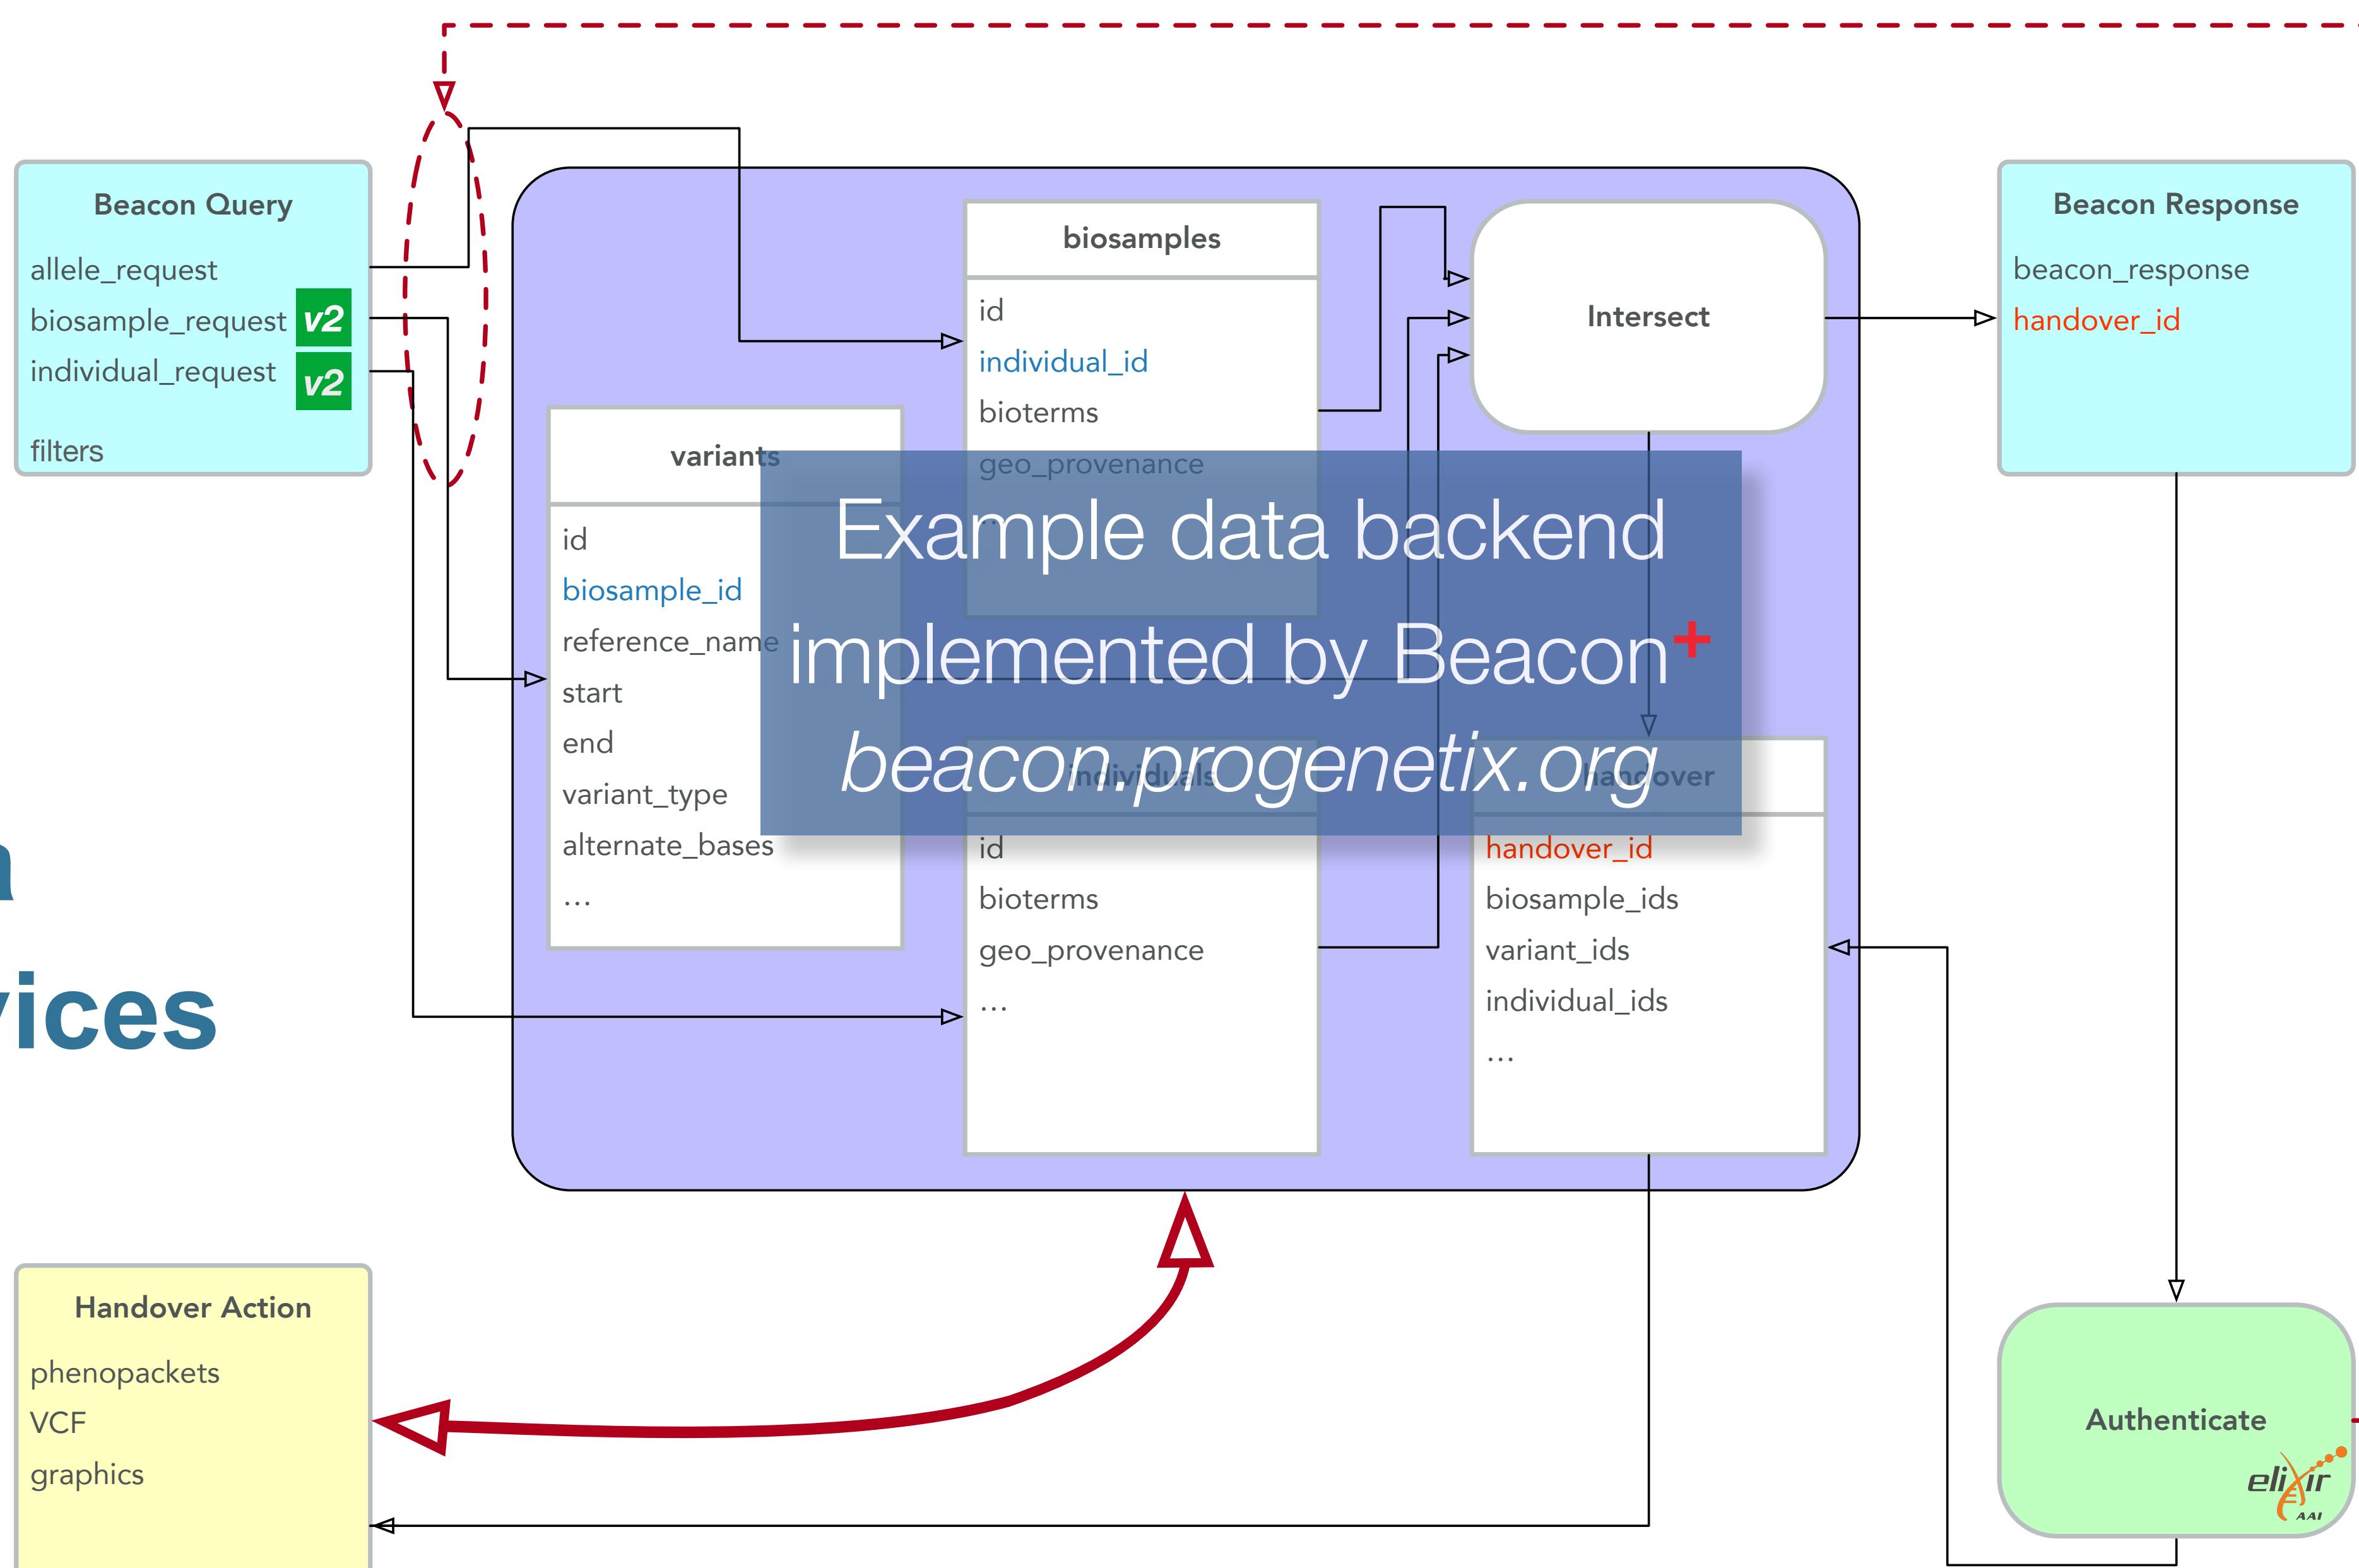

Mismatches
- too large
- end outside
- start outside

- Beacon+ **range queries** allow the definition of a genome region of interest, containing a specified variant (or other mappable feature)
- “fuzzy” matching of region ends is essential for features without base specific positions
- current Beacon implementation addresses CNV (DUP, DEL), as are specified in VCF && GA4GH variant schema

Beacon & Handover

Beacons v1.1
supports data
delivery services

```

Beacon Handover

- only exposure of access handle to data stored in secure system
- one-step authentication and selection of *handover* action; other scenarios possible / likely
- *handover response* **outside of Beacon protocol / system**

This example shows a core Beacon query, against a specific mutation in the TP53 gene, in cellosaurus, with ClinVar data.

Beacon Query

Beacon+

Flexible Modeling of New Features

Our Beacon platform is being used for the rapid testing of queries and responses - both v1.n and v2.0.a - against a number of partially large-scale genome datasets.

- Progenetix (>100000 cancer CNV profiles)
- DIPG (childhood brain tumor study)
- NEW: Cellosaurus ClinVar annotations for evidence representation
- Brewing: COVID-19

Currently running on a Perl+MongoDB stack, a Python-based OS solution is in early development.

Beacon v1 Development

2014

GA4GH founding event; Jim Ostell proposes Beacon concept including "more features ... version 2"

2015

- beacon-network.org aggregator created by DNAstack

2016

- Beacon v0.3 release
- work on queries for structural variants (brackets for fuzzy start and end parameters...)

2017

- OpenAPI implementation
- integrating CNV parameters (e.g. "startMin, statMax")

2018

- Beacon v0.4 release in January; feature release for GA4GH approval process
- GA4GH Beacon v1 approved at Oct plenary

2019

- ELIXIR Beacon Network

2020

Beacon v2 Development

- Beacon⁺ concept implemented on progenetix.org
- concepts from GA4GH Metadata (ontologies...)
- entity-scoped query parameters ("individual.age")

- Beacon⁺ demos "handover" concept

- Beacon hackathon Stockholm; settling on "filters"
- Barcelona goes Zurich developers meeting
- Beacon API v2 Kick off
- adopting "handover" concept
- "Scouts" teams working on different aspects - filters, genomic variants, compliance ...
- discussions w/ clinical stakeholders

- framework + models concept implemented
- range and bracket queries, variant length parameters
- starting of GA4GH review process
- further changes esp. in default model, aligning with Phenopackets and VRS
- unified beacon-v2 code & docs repository
- Beacon v2 approved at Apr GA4GH Connect

2022

Related ...

- ELIXIR starts Beacon project support
- GA4GH re-structuring (workstreams...)
- Beacon part of Discovery WS
- new Beacon website (March)
- Beacon publication at Nature Biotechnology

[Baudisgroup @ UZH](#)

[Cancer genome data @ progenetix.org](#)

The Progenetix database provides an overview of mutation data in cancer, with a focus on copy number abnormalities (CNV / CNA), for all types of human malignancies. The data is based on *individual sample data* from currently **139448** samples.

Breast Cancer by AJCC v6 Stage (NCIT:C90513)

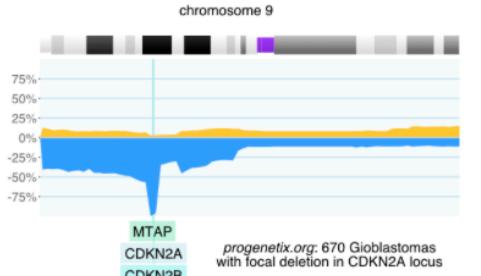

[Download SVG](#) | [Go to NCIT:C90513](#) | [Download CNV Frequencies](#)

Example for aggregated CNV data in 362 samples in Breast Cancer by AJCC v6 Stage. Here the frequency of regional **copy number gains** and **losses** are displayed for all 22 autosomes.

[Progenetix Use Cases](#)

[Local CNV Frequencies](#)

A typical use case on Progenetix is the search for local copy number aberrations - e.g. involving a gene - and the exploration of cancer types with these CNVs. The [[Search Page](#)] provides example use cases for designing queries. Results contain basic statistics as well as visualization and download options.

[Cancer CNV Profiles](#)

The progenetix resource contains data of **810** different cancer types (NCIt neoplasm classification), mapped to a variety of biological and technical categories. Frequency profiles of regional genomic gains and losses for all categories (diagnostic entity, publication, cohort ...) can be accessed through the [[Cancer Types](#)] page with direct visualization and options for sample retrieval and plotting options.

[Cancer Genomics Publications](#)

Through the [[Publications](#)] page Progenetix provides **4025** annotated references to research articles from cancer genome screening experiments (WGS, WES, aCGH, cCGH). The numbers of analyzed samples and possible availability in the Progenetix sample collection are indicated.

Abstract

In cancer, copy number aberrations (CNAs) represent a type of nearly ubiquitous and frequently extensive structural genome variations. To disentangle the molecular mechanisms underlying tumorigenesis as well as identify and characterize molecular subtypes, the comparative and meta-analysis of large genomic variant collections can be of immense importance. Over the last decades, cancer genomic profiling projects have resulted in a large amount of somatic genome variation profiles, however segregated in a multitude of individual studies and datasets. The Progenetix project, initiated in 2001, curates individual cancer CNA profiles and associated metadata from published oncogenomic studies and data repositories with the aim to empower integrative analyses spanning all different cancer biologies. During the last few years, the fields of genomics and cancer research have seen significant advancement in terms of molecular genetics technology, disease concepts, data standard harmonization as well as data availability, in an increasingly structured and systematic manner. For the Progenetix resource, continuous data integration, curation and maintenance have resulted in the most comprehensive representation of cancer genome CNA profiling data with 138 663 (including 115 357 tumor) copy number variation (CNV) profiles. In this article, we report a 4.5-fold increase in sample number since 2013, improvements in data quality, ontology representation with a CNV landscape summary over 51 distinctive National Cancer Institute Thesaurus cancer terms as well as updates in database schemas, and data access including new web front-end and programmatic data access.

Database URL: progenetix.org

Table 1. Statistics of samples from various data resources

Collections					
Individuals	63 568	4351	19 712	10 995	127 549
Biosamples	63 568	4351	19 712	22 142	138 663
Callsets ^a	63 568	4351	19 712	22 376	138 930
Variants	5 514 126	118 4170	1 778 096	2 654 065	10 716 093

^aset of variants from one genotyping experiment; ICD-O, International Classification of Diseases for Oncology; NCIt, National Cancer Institute Thesaurus.

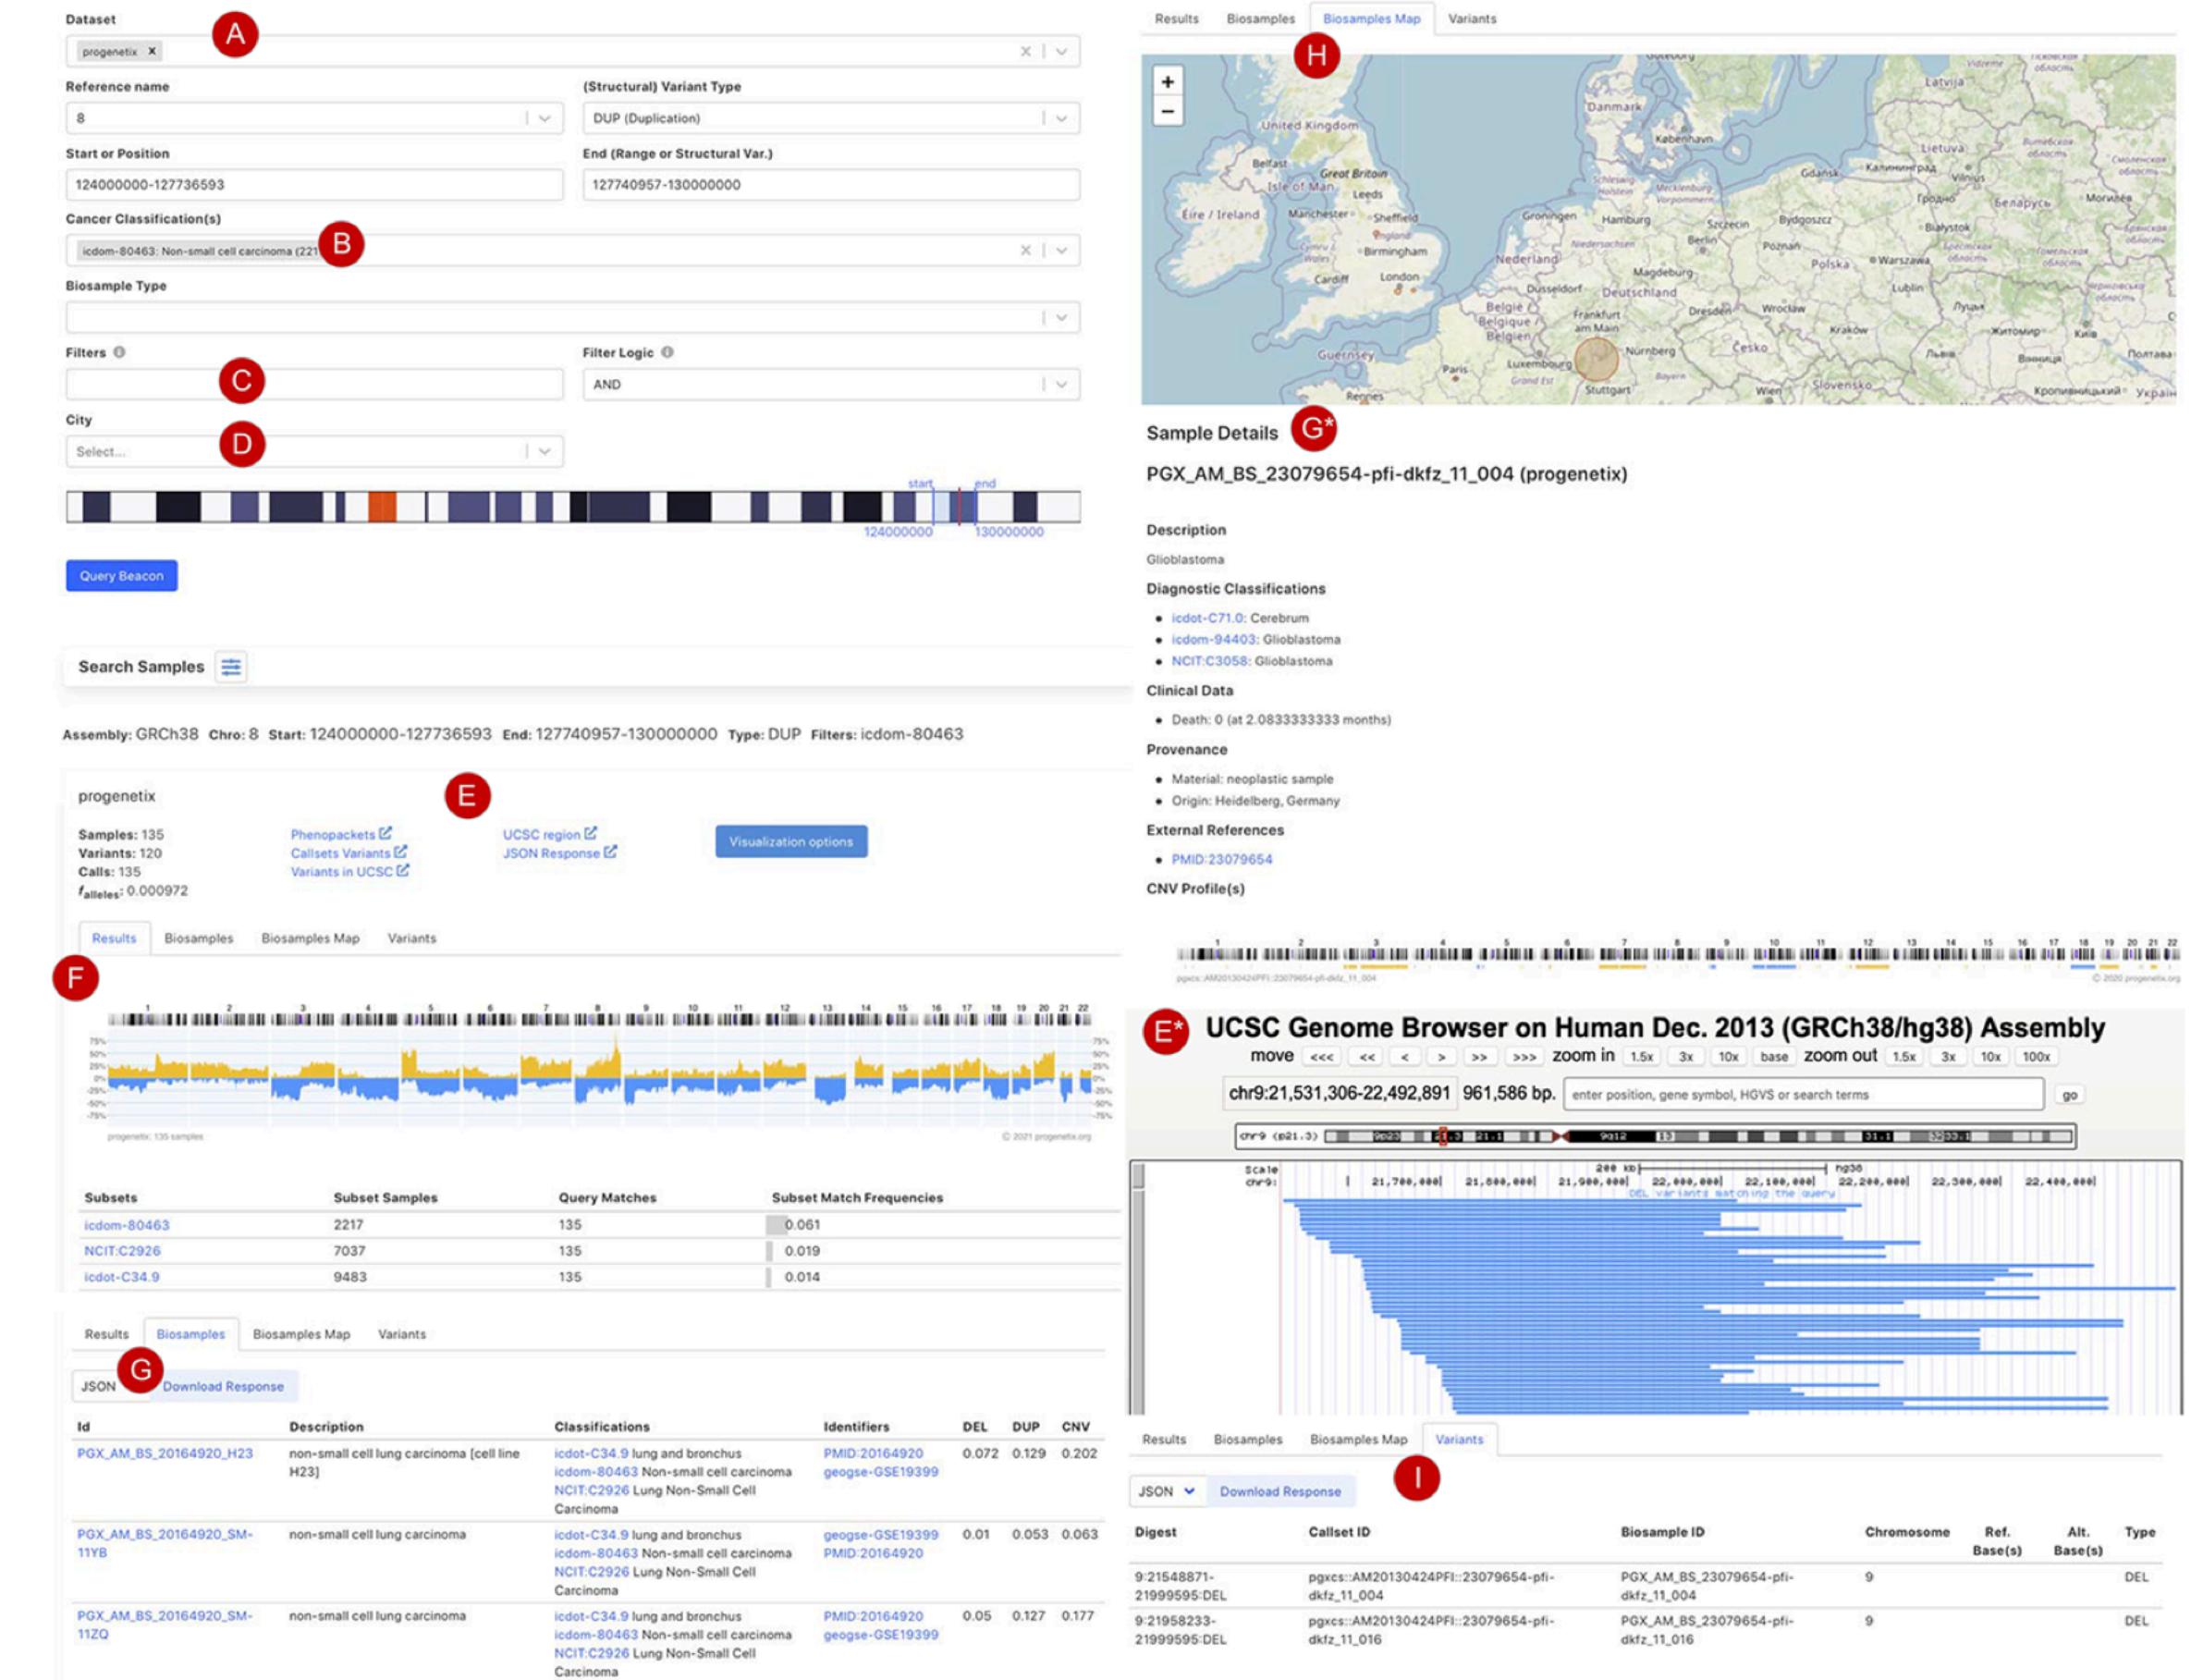

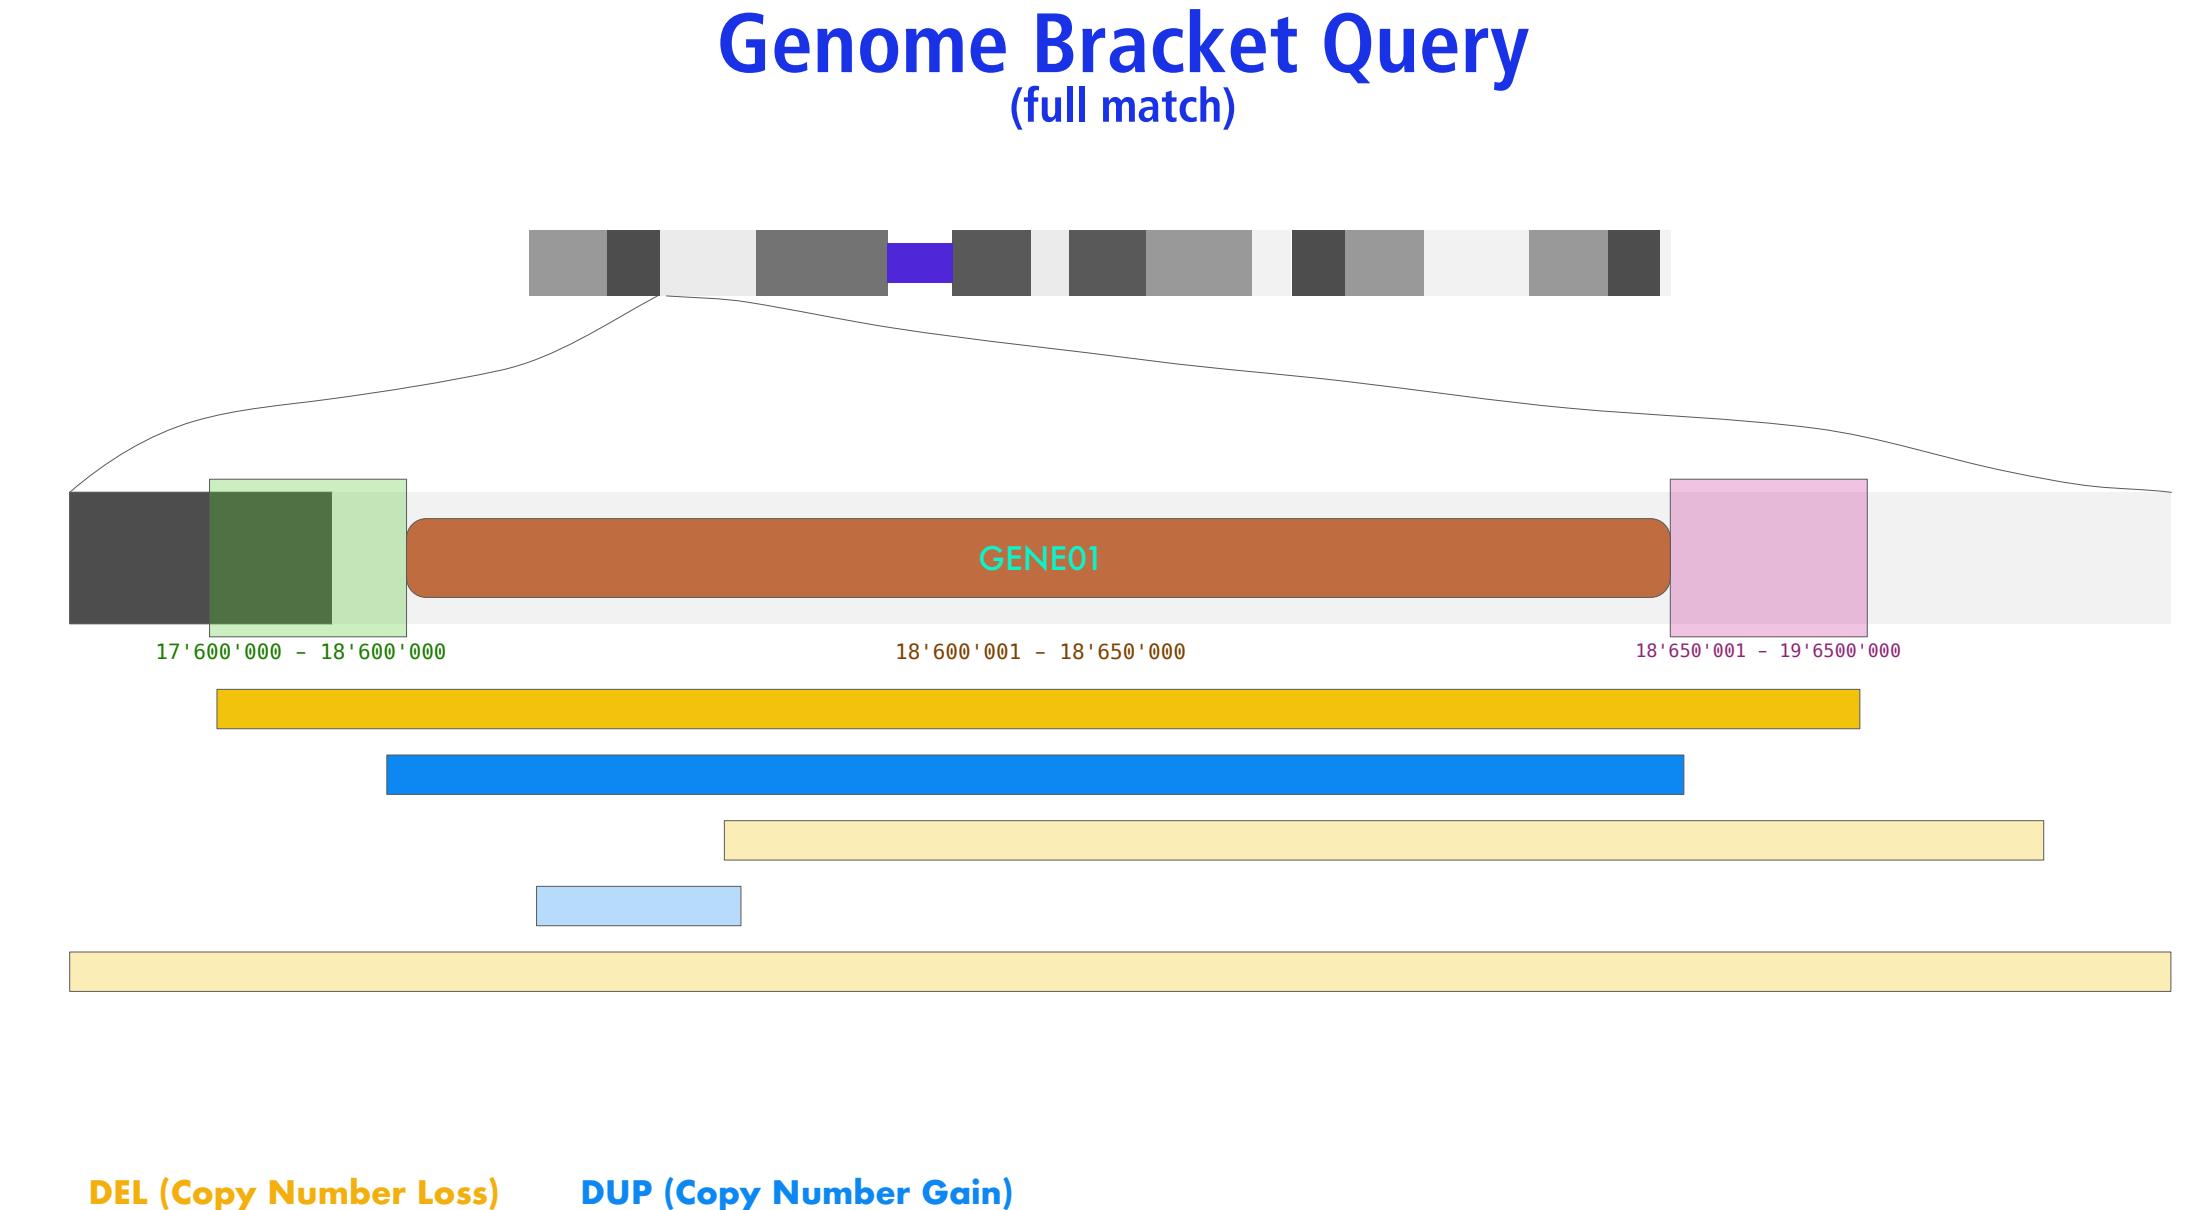

Figure 3. Beacon-style query using fuzzy ranges to identify biosamples with variants matching the CNA range. This example queries for a continuous, focal duplication covering the complete MYC gene's coding region with ≤ 6 Mb in size. A: Filter for dataset; B: filter for cancer classification (NCIt and ICD-O-3 ontology terms available); C: additional filter, e.g. Cellosaurus; D: additional filter for geographic location; E: external link to UCSC browser to view the alignment of matched variants; F: cancer type classification sorted by frequency of the matched biosamples present in the subset; G: list of matched variants with reference to biosamples can be downloaded in json or csv format.

CDKN2A Deletion Example MYC Duplication TP53 Del. in Cell Lines K-562 Cell Line

Gene Spans Cytoband(s)

This example shows the query for CNV deletion variants overlapping the CDKN2A gene's coding region with at least a single base, but limited to "highly focal" hits (here i.e. $\leq \sim 1\text{Mbp}$ in size). The query can be modified e.g. through changing the position parameters or diagnosis.

Beacon v2 Conformity and Extensions in Progenetix

Putting the **+** into Beacon ...

- support & use of standard Beacon v2 PUT & GET variant queries, filters and meta parameters
 - variant parameters, genelid, lengths, EFO & VCF CNV types, pagination
 - widespread, self-scoping filter use for bio-, technical- and id parameters with switch for descending terms use (globally or per term if using POST)
- extensive use of handovers
 - asynchronous delivery of e.g. variant and sample data, data plots
- **+** extensions of query logic
 - optional use of OR logic for filter combinations (global)
- **+** extension of query parameters
 - geographic queries incl. \$geonear and use of GeoJSON in schemas
- ↴ ↵ ↷ ↸ no implementation of authentication on this open dataset

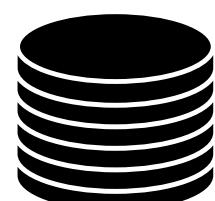

Progenetix provides a number of additional services and output formats which are initiated over the /services path or provided as request parameters and are not considered Beacon extensions (though they follow the syntax where possible).

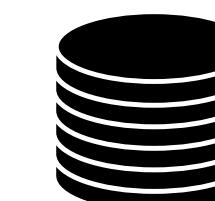

Progenetix Stack

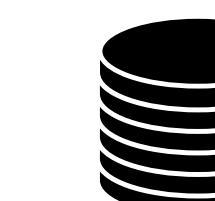

- JavaScript front-end is populated for query results using asynchronous access to multiple handover objects
 - ▶ biosamples and variants tables, CNV histogram, UCSC .bed loader, .pgxseg variant downloads...
- the complete middleware / CGI stack is provided through the *bycon* package
 - ▶ schemas, query stack, data transformation (e.g. Phenopackets generation)...
- data collections mostly correspond to the main Beacon default model entities
 - ▶ no separate *runs* collection; integrated w/ analyses
 - ▶ *variants* are stored per observation instance

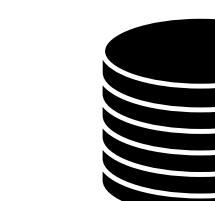

variants

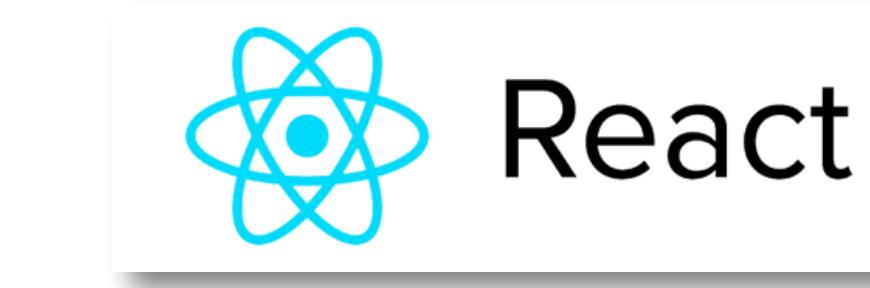

analyses

biosamples

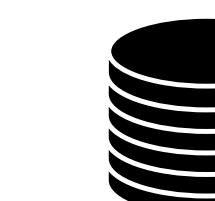

individuals

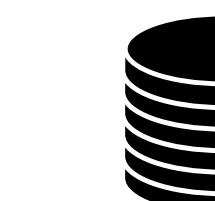

- *collations* contain pre-computed data (e.g. CNV frequencies, statistics) and information for all grouping entity instances and correspond to **filter values**
 - ▶ PMID:10027410, NCIT:C3222, pgx:cohort-TCGA, pgx:icdom-94703...
- *querybuffer* stores id values of all entities matched by a query and provides the corresponding access handle for **handover** generation

Progenetix Source Code

With exception of some utility scripts and external dependencies (e.g. [MongoDB](#)) the software (from database interaction to website) behind Progenetix and Beacon+ is implemented in Python.

bycon

- Python based service based on the [GA4GH Beacon protocol](#)
- software powering the Progenetix resource
- [Beacon+](#) implementation(s) use the same code base

progenetix-web

- website for Progenetix and its [Beacon+](#) implementations
- provides Beacon interfaces for the [bycon](#) server, as well as other Progenetix services (e.g. the [publications](#) service)
- implemented as [React / Next.js](#) project
- contains this documentation tree here as [mkdocs](#) project, with files in the [docs](#) directory

Beacon API

Beacon-style JSON responses

The Progenetix resource's API utilizes the [bycon](#) framework for data query and delivery and represents a custom implementation of the Beacon v2 API.

The standard format for JSON responses corresponds to a generic Beacon v2 response, with the [meta](#) and [response](#) root elements. Depending on the endpoint, the main data will be a list of objects either inside [response.results](#) or (mostly) in [response.resultSets.results](#). Additionally, most API responses (e.g. for biosamples or variants) provide access to data using [handover](#) objects.

Progenetix & Beacon⁺

The Beacon+ implementation - developed in the Python & MongoDB based [bycon](#) project - implements an expanding set of Beacon v2 paths for the [Progenetix](#) resource [+](#).

Scoped responses from query object

In queries with a complete [beaconRequestBody](#) the type of the delivered data is independent of the path and determined in the [requestedSchemas](#). So far, Beacon+ will compare the first of those to its supported responses and provide the results accordingly; it doesn't matter if the endpoint was [/beacon/biosamples/](#) or [/beacon/variants/](#) etc.

Below is an example for the standard test "small deletion CNVs in the CDKN2A locus, in gliomas" Progenetix test query, here responding with the matched variants. Exchanging the [entityType](#) entry to

- { "entityType": "biosample", "schema": "https://progenetix.org/services/schemas/Biosample/" }

would change this to a biosample response. The example can be tested by POSTing this as [application/json](#) to <http://progenetix.org/beacon/variants/> or <http://progenetix.org/beacon/biosamples/>.

```
{
  "$schema": "beaconRequestBody.json",
  "meta": {
    "apiVersion": "2.0",
    "requestedSchemas": [
      {
        "entityType": "genomicVariant",
        "schema": "https://progenetix.org/services/schemas/genomicVariant"
      }
    ],
    "query": {
      "requestParameters": {
        ...
      }
    }
  }
}
```

Shoutout to Laure(e)n Fromont & Manuel Rueda for being instrumental in the Beacon v2 documentation!

pgxRpi

An interface API for analyzing Progenetix CNV data in R using the Beacon+ API

Beacon Path: Retrieve variants by biosample id(s)

```
https://progenetix.org/beacon/g_variants/

http://www.progenetix.org/services/intervalFrequencies/
?id=NCIT:C4323&output=pgxseg
```

README.md

pgxRpi

This is an API wrapper package to access data from Progenetix database.

You can install this package from GitHub using:

```
install.packages("devtools")
devtools::install_github("progenetix/pgxRpi")
```

If you are interested in accessing CNV variant data, get started from this [vignette](#)

If you are interested in accessing CNV frequency data, get started from this [vignette](#)

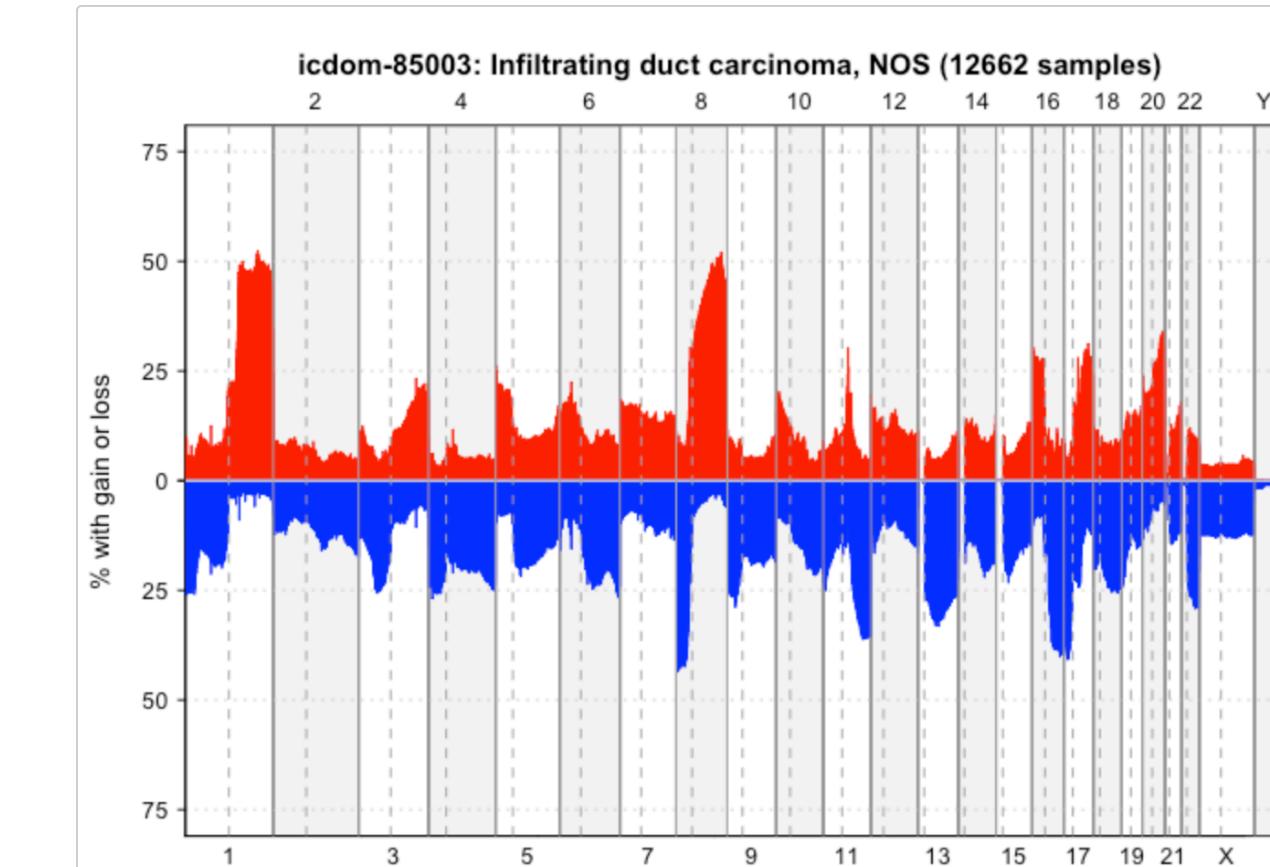

When you face problems, try to reinstall the latest version. If reinstallation doesn't help, please contact us.

```
variant_1 <- pgxLoader(type="variant", biosample_id = biosample_id)

biosamples <- pgxLoader(type="biosample", filters = "NCIT:C3059", codematches = TRUE,
                       biosample_id = c("pgxb-s-kftva5zv", "pgxb-s-kftva5zw"))
```

```
freq_pgxseg <- pgxLoader(type="frequency", output = 'pgxseg',
                           filters=c("NCIT:C4038", "pgx:icdom-85003"),
                           codematches = TRUE)
```

```
pgxFreqplot(freq_pgxseg, filters='pgx:icdom-85003')
```

Beacon⁺: Phenopackets

Testing alternative response schemas...

<http://progenetix.org/beacon/biosamples/pgxbs-kftvhyvb/phenopackets>

- the v2 default schemas are mostly aligned w/ Phenopackets v2
- creating phenopackets can be done mostly by re-wrapping of Beacon entities (individual, biosample)
- variants can be included through file resource URLs; in Beacon⁺ this is done through *ad hoc* handover URIs

    data_db = mongo_client[ds_id]
    pxf_s = []

    for ind_i, ind in enumerate(r_s_res):

        pxf = phenopack_individual(ind, data_db, byc)
        pxf_s.append(pxf)

    return pxf_s
```

Future?

Some proposals for a stepwise Beacon protocol extension

- Boolean options for chaining filters
 - ➡ use of heterogeneous/alternative annotations within and across resources
- Phenopackets support as a (the?) default format for biodata export
- PXF as request documents
- Focus on service & resource discovery
- ELIXIR Beacon Network, including translations for federated queries to Beacon and Beacon-like resources

Have you seen deletions in this region on chromosome 9 in Glioblastomas from a juvenile patient, in a dataset with unrestricted access?

Beacon v2 API

The Beacon API v2 proposal opens the way for the design of a simple but powerful "genomics API".

Thank You!
